

Our Services

Atlas has successfully delivered architectural support services for education-based projects in the UK, Australia and North Africa, assisting in the preparation of drawings such as plans, elevations, sections, and details through the design development and construction documentation phases. We have a comprehensive working experience of all relevant construction technologies including concrete and steel frame. We have worked on phased planning projects, as well as more traditional programmes, and can deliver specific and non-specific detailing.

With database overlays to the CAD drawings, we can produce automated scheduling of all internal elements for these educational facilities. These can aid construction management procurement as well as detailed elemental bills of quantities, and the more traditional architectural packaging by trades.

Project Scale

Atlas has worked on primary, secondary and tertiary education projects and has assisted on single academies, whole new and refurbished campuses, the UK Building Schools for the Future (BSF) programme, and multiple deliveries of universities across various sites. Our programme of involvement has been from 1 to 9 months.

Production Process

We typically produce CAD documentation to an agreed list of deliverables, working in strict accordance with client protocols and communication methodologies, and working from client briefing documents, hand sketches and marked up drawings.

Our service can be tailored to meet any client requirements, and all our work is managed, supervised and quality assured by UK and Australian architectural professionals to ensure international standards are met.
